Before starting acid radicals practicals, students should prepare by:

- Reviewing the theoretical basis of each reaction.
- Assembling necessary reagents and apparatus such as test tubes, burettes, pipettes, and reagents like silver nitrate, barium chloride, hydrochloric acid, etc.

Safety precautions include:

- Wearing safety goggles, gloves, and lab coats.

- Handling acids and other chemicals carefully to prevent spills or splashes.
- Properly disposing of chemical waste.
- Working in a well-ventilated area or under a fume hood when necessary.

Standard Procedures for Acid Radicals Practicals

Performing qualitative analysis of acid radicals involves systematic steps:

- Preliminary Tests: Detect the presence of acid radicals by observing physical properties and simple tests.
- Confirmatory Tests: Use specific reagents to confirm the identity of each acid radical.
- Separation of Ions: In mixtures, separate ions through selective precipitation and filtration.

Below are detailed procedures for common acid radicals:

Identification of Common Acid Radicals

1. Testing for Chloride Ion (Cl^-)

Reagents Needed: Silver nitrate (AgNO_3), dilute nitric acid (HNO_3)

Procedure:

- Take a small amount of the salt solution in a test tube.
- Acidify the solution with dilute HNO_3 to remove any interference.
- Add a few drops of AgNO_3 solution.
- Observe the formation of a white precipitate of silver chloride (AgCl).

Confirmation:

- The precipitate is insoluble in water but dissolves in dilute ammonia solution, confirming chloride presence.

2. Testing for Sulfate Ion (SO_4^{2-})

Reagents Needed: Barium chloride (BaCl_2)

Procedure:

- Acidify the solution with HCl to prevent interference from carbonate or sulfite ions.
- Add BaCl₂ solution to the sample.
- A white precipitate of barium sulfate (BaSO₄) indicates the presence of sulfate ions.

Confirmation:

- The precipitate is insoluble in acetic acid but dissolves in hot dilute sulfuric acid.

3. Testing for Nitrate Ion (NO₃⁻)

Reagents Needed: Devarda's alloy or copper turnings, sodium hydroxide (NaOH), and aluminum foil.

Procedure:

- Add a small piece of copper turnings or Devarda's alloy to the solution.
- Add NaOH solution and warm gently.
- A pungent gas (NO₂) is evolved, which turns moist red litmus paper brown due to NO₂ formation.

Confirmation:

- Alternatively, use the brown ring test:
- Add a few drops of concentrated sulfuric acid to the solution.
- Carefully add an equal volume of concentrated iron(II) sulfate solution.
- A brown ring forms at the junction, indicating nitrate ions.

4. Testing for Carbonate and Bicarbonate Ions (CO₃²⁻ and HCO₃⁻)

Reagents Needed: Dilute acids (like HCl)

Procedure:

- Add dilute HCl to the sample.
- Effervescence of CO₂ gas occurs.
- Pass the gas through limewater (calcium hydroxide solution); if it turns milky, carbonate or bicarbonate is confirmed.

Differentiation:

- Bicarbonate reacts faster with acids and produces CO₂ more rapidly than carbonate.
- Heating the solution can convert bicarbonate to carbonate, aiding differentiation.

Advanced Acid Radicals Identification in Mixtures

In practical scenarios, mixtures of acid radicals often exist, requiring systematic separation techniques:

Steps include:

- Precipitation: Use specific reagents to precipitate certain ions selectively.
- Filtration: Separate precipitates from the solution.
- Dissolution and Confirmatory Tests: Dissolve precipitates in suitable acids or solutions and perform confirmatory tests.

Example:

- To identify chloride and sulfate ions:
- First, precipitate chloride with AgNO₃; filter.
- To the filtrate, add BaCl₂; sulfate will precipitate.
- Confirm each precipitate with respective confirmatory tests.
