Introduction to Gnetum

Gnetum belongs to the family Gnetaceae within the division Gnetophyta. It comprises approximately 35 species of evergreen trees and climbing shrubs predominantly found in tropical regions of Africa, Asia, and Central and South America. Gnetum is notable for its evolutionary link between gymnosperms and angiosperms, exhibiting a mix of features characteristic of both groups.

Understanding its morphology through a labelled diagram helps clarify its distinctive features, such as its leaves, reproductive organs, and stem structure. Visual aids are crucial in botany for accurate identification and comparison of plant species.

Components of the Labelled Diagram of Gnetum

A typical labelled diagram of Gnetum includes several key parts, each with specific structural and functional attributes. Below, we dissect each component in detail.

1. Stem

The stem of Gnetum is usually slender, woody, and sometimes climbing, with a prominent central pith. It provides structural support and houses vascular tissues responsible for transporting water, nutrients, and food.

Features:

- Vascular bundles: Arranged in a complex ring, enabling efficient conduction.
- Lenticels: Small openings on the stem surface for gaseous exchange.

- Outer cortex: Composed of parenchyma cells that store food.

Significance: The stem's structure supports the plant's growth form, whether as a climbing vine or shrub.

2. Leaves

Gnetum leaves are broad, leathery, and evergreen, which distinguishes them from many gymnosperms. They are arranged alternately along the stem.

Features:

- Shape: Usually ovate or lanceolate.
- Venation: Net-like (reticulate venation), similar to angiosperms.
- Petiole: Attaches the leaf blade to the stem.

Function: Photosynthesis, transpiration, and gas exchange are primary functions facilitated by the leaves.

3. Reproductive Structures

Gnetum exhibits distinct reproductive organs, which are crucial for identification and understanding of its reproductive cycle.

a) Male Cones (Staminate Cones)

- Comprise several microsporophylls (microsporangia-bearing leaves).
- Microsporangia produce pollen grains.

b) Female Cones (Ovulate Cones)

- Consist of megasporophylls bearing ovules.
- Each ovule develops into a seed after fertilization.

Features:

- Both male and female cones are borne on the same plant (monoecious), though some species

are dioecious.

Significance: The reproductive structures demonstrate the plant's method of pollination and seed development.

4. Seeds

After fertilization, seeds develop within the ovules. Gnetum seeds are often fleshy and resemble angiosperm seeds.

Features:

- Outer seed coat: Protects the developing embryo.
- Embryo: Contains the early developmental stage of the new plant.

Importance: Seed morphology provides clues about the evolutionary links between gymnosperms and angiosperms.

5. Vascular System

Gnetum's vascular tissues are arranged to facilitate efficient transport:

- Xylem: Conducts water and minerals.
- Phloem: Transports food.

The arrangement of vascular bundles in Gnetum's stem resembles that of angiosperms, which is a notable feature.
