Sample Biozone RA 1 Questions and Answers

Below are some sample questions with detailed answers to illustrate what you can expect and how to approach them.

Question 1: What is the primary function of the cell membrane?

Answer:

The primary function of the cell membrane is to regulate the movement of substances into and out of the cell. It acts as a selective barrier, maintaining homeostasis by controlling the internal environment of the cell. The membrane is composed of a phospholipid bilayer with embedded proteins, which facilitate transport and communication.

Question 2: Explain Mendel's Law of Segregation.

Answer:

Mendel's Law of Segregation states that during the formation of gametes (sperm and egg), the two alleles for a gene separate or segregate so that each gamete carries only one allele for each gene. This ensures that offspring inherit one allele from each parent. The law explains the inheritance

patterns of dominant and recessive traits.

Question 3: Describe the process of natural selection.

Answer:

Natural selection is the process where organisms with advantageous traits are more likely to survive and reproduce, passing those traits to their offspring. Over generations, this leads to the adaptation of species to their environment. The key steps include variation, competition, differential survival, and reproduction.

Question 4: List three components of an ecosystem.

Answer:

- Producers (e.g., plants and algae)
- Consumers (e.g., herbivores, carnivores)
- Decomposers (e.g., fungi, bacteria)

Sample Questions and Model Answers

Providing concrete examples helps illustrate effective answering techniques.

Question 1:

Describe the process of mitosis and its significance in organisms.

Answer:

Mitosis is a type of cell division that results in two genetically identical daughter cells from a single parent cell. It occurs through several stages: prophase, metaphase, anaphase, and telophase. During prophase, chromosomes condense, and the nuclear envelope begins to break down. In metaphase, chromosomes align at the cell's equatorial plate. Anaphase involves the separation of sister chromatids as spindle fibers pull them apart to opposite poles. Finally, in telophase, new nuclear membranes form around the separated sets of chromosomes, completing cell division with cytokinesis, where the cytoplasm divides, producing two daughter cells. Mitosis is vital for growth, tissue repair, and asexual reproduction in multicellular organisms, ensuring genetic consistency across cells.

Question 2:

Explain the role of natural selection in evolution.

Answer:

Natural selection is a process by which organisms with favorable traits are more likely to survive and reproduce, passing those traits to their offspring. Over generations, this leads to the adaptation of populations to their environment. The process involves variation within a population, differential survival and reproduction, and inheritance of advantageous traits. For example, in a population of beetles, those with a coloration that camouflages them from predators are more likely to survive and reproduce, increasing the frequency of that trait in subsequent generations. Natural selection drives evolutionary change by favoring beneficial adaptations, leading to the diversity of life observed today.
