- Find another point: $x=2$, $y=2(2)-3=1$
- Plot the points $(0, -3)$ and $(2, 1)$, then draw the straight line through them.

Tip: Use a table of values for more complex equations.

Word Problems Involving Linear Relationships

Example Question:

A taxi charges a base fare of £3 plus £1.50 per mile. Write an equation for the total cost C in terms of miles traveled m .

Approach:

- Total cost = base fare + (cost per mile) × miles
- $C = 3 + 1.5m$

Tip: Identify fixed costs and variable costs clearly.

Sequence and Series Questions

Example Question:

Find the 10th term of the sequence: 5, 8, 11, 14...
