Sample Questions and Their Answers

Question 1: What are the main layers of the Earth, and what are their characteristics?

Answer: The Earth's main layers are:

- **Crust:** The outermost layer, solid, and relatively thin. Composed of continental and oceanic crust.
- **Mantle:** Below the crust, semi-solid, extends to about 2,900 km deep. Responsible for convection currents driving plate movements.
- **Outer Core:** Liquid layer composed mainly of iron and nickel, around 2,200 km thick. Generates Earth's magnetic field.
- **Inner Core:** Solid sphere primarily made of iron and nickel, with a radius of about 1,220 km.

Question 2: Explain how earthquakes occur and what causes the different types of seismic waves.

Answer: Earthquakes occur due to the sudden release of energy along faults in the Earth's crust, often caused by tectonic plate movements. The primary causes include stress accumulation at plate boundaries and volcanic activity.

Seismic waves are categorized into:

- **P-waves (Primary Waves):** Compressional waves that travel fastest and arrive first. They can move through solids and liquids.
- **S-waves (Secondary Waves):** Shear waves that move perpendicular to wave direction. They only travel through solids and are slower than P-waves.
- **Surface Waves:** Travel along Earth's surface, causing most of the damage during earthquakes. They include Love and Rayleigh waves.

Question 3: Describe the greenhouse effect and its impact on Earth's climate.

Answer: The greenhouse effect is a natural process where certain gases in Earth's atmosphere (such as carbon dioxide, methane, and water vapor) trap heat from the sun, keeping the planet warm enough to support life. However, human activities like burning fossil fuels have increased these gases, intensifying the greenhouse effect. This leads to global warming, climate change, rising sea levels, and extreme weather patterns.

- Explain how weathering contributes to soil formation.

Answer: Weathering breaks down rocks into smaller particles through physical, chemical, and biological processes. Physical weathering fragments rocks mechanically; chemical weathering alters mineral composition; biological weathering involves plant roots and organisms breaking down rocks. These processes produce mineral particles and organic matter, forming soil over time.

- Compare and contrast intrusive and extrusive igneous rocks.

Answer: Intrusive igneous rocks crystallize beneath Earth's surface, resulting in coarse-grained textures due to slow cooling (e.g., granite). Extrusive igneous rocks solidify on Earth's surface, cooling quickly and forming fine-grained textures (e.g., basalt).

- Outline the global effects of climate change.

Answer: Climate change leads to rising global temperatures, melting ice caps, rising sea levels, increased frequency of extreme weather events, and disruptions to ecosystems. These changes threaten biodiversity, agriculture, and human health, necessitating global efforts for mitigation and

adaptation.
