- a. Bubble Sort
- b. Quick Sort
- c. Selection Sort
- d. Insertion Sort

Answer: b. Quick Sort

Explanation:

- Bubble Sort and Selection Sort both have average and worst-case complexities of $O(n^2)$.
- Insertion Sort also exhibits $O(n^2)$ behavior in the average and worst cases.
- Quick Sort's average-case time complexity is $O(n \log n)$, making it efficient for large datasets, although its worst-case is $O(n^2)$.
- Therefore, the correct answer is Quick Sort.

- Merge Sort is inherently stable if implemented correctly because it merges sorted subarrays without changing the order of equal elements.
- Quick Sort, Heap Sort, and Selection Sort are generally not stable, though stability can be achieved with modifications.
- The most straightforward stable algorithm among these options is Merge Sort.

Question 4: Dynamic Programming Application

Q: Which approach is best suited for solving the 0/1 Knapsack problem?

- a. Greedy Algorithm
- b. Divide and Conquer
